

A COMPOSITE BASKET

Abstract

A basket comprises one or more bendable sheets of material that are configured to cooperate to bend and engage their cooperating edges to form a continuous basket side wall. A bottom frame is attachable to the sheets of material to provide a bottom to the basket and lend rigidity to the side wall. An upper ring is configured to attach to the sheets of material opposite the bottom frame to define an upper opening and further provide rigidity to the basket. The basket may be disassembled such as for storage, shipping, and transportation in a flattened configuration.
